C -: FUNCTION: THE 120 kDa SURFACE-EXPOSED PROTEIN IS A MAJOR

STRUCTURAL PROTEIN WHICH MAY PLAY A ROLE AS A RICKETTSIAL

VIRULENCE FACTOR RAD, ORR IMMONOGEN DURING INPECTION.

CC -: SUBCELLULAR LOCATION: CELL WALL. THIS BACTERIUM IS COVERED BY A SC

LAYER WITH HEXAGONAL SYMMETRY.

CC -- SIMILARITY: BELONGS TO THE RICKETTSIAE OMPA/OMPB FAMILY.

Outer membrane protein B precursor (168 kDa surface-layer protein)
(Surface protein antigen) (Cell surface antigen 5) (Scas) (Gnome)
(rCmp B) (Contains: 120 kDa surface-exposed protein (Surface protein antigen)) (120 kDa outer membrane protein ompB); 32 kDa beta peptide).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ø

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                US-09-701-271A-2

Sequence 33073, Application US/09252991A

Patent No. 6551795

GENERAL INFORMATION:
APPLICANT: MAIC J.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
FILE REPRENCE: 107196.136
CURRENT APPLICATION NUMBER: US 60/074,788
PRIOR APPLICATION NUMBER: US 60/074,788
PRIOR APPLICATION NUMBER: US 60/094,190
PRIOR FILING DATE: 1998-02-18
PRIOR FILING DATE: 1998-07-27
NUMBER OF SEQ ID NOS: 33142

LENGTH: 751
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             20;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Length 1536;
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
COMPATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, Version #1.30
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/719,641
FILING DATE:
CLASSIFICATION NUMBER: US/08/719,641
PRIOR APPLICATION NUMBER: US/08/719,641
PRIOR APPLICATION NUMBER: US 08/302,832
FILING DATE: 16-SEP-1994
PRIOR APPLICATION NUMBER: US PCT/US93/02166
FILING DATE: 16-MAR-1993
PRIOR APPLICATION NUMBER: US PCT/US93/02166

Sequence 6', Application US/09206942;
Patent No. 6432669;
GENERAL INFORMATION:
APPLICANT: Locemore. Sheena M.
APPLICANT: Aran, Yan-Ping
APPLICANT: Vario, Yan-Ping
APPLICANT: Michel H.
ITILE OF INVENTION: Protective Recombinant Haemophilus Influenzae High
ITILE OF INVENTION: Molecular Weight Proteins
FILE REFERENCE: 1038-861 MIS:jb
CURRENT APPLICATION NUMBER: US/09/206,942;
CURRENT FILING DATE: 1998-12-08
EARLIER FILING DATE: 1998-10-07
NUMBER OF SEQ ID NOS: 95
SOFTWARE: PatentIN Ver. 2.1

Sequence 9. Application US/08617697

Patent No. 5977336

GENERAL INVENTION:

APPLICANT: Barenkamp, Stephen J

TITLE OF INVENTION: High Molecular Weight Surface Proteins

TITLE OF INVENTION: of No. 5977336-Typeable Haemophilus

NUMBER OF SEQUENCES: 11

CORRESPONDENCE ADDRESS:

ADDRESSEE: Shoemaker and Mattare, Ltd.

ADDRESSEE: Shoemaker in Mattare, Ltd.

ADDRESSEE: Shoemaker in Mattare, Ltd.

US-09-206-942-34
is sequence 34, Application US/09206942
patent No. 643269
general INFORMATION:
REPLICANT: Loosance, Sheena M.
APPLICANT: Application Michel H.
TITLE OF INVENTION: Procedure Recombinant Haemophilus Influenzae High
TITLE OF INVENTION: Procedure Weight Proteins
FILE REFERENCE: 1030-861 MIS:jb
CURRENT APPLICATION NUMBER: US/09/206,942
CURRENT FILING DATE: 1998-12-08
EARLIER APPLICATION NUMBER: 09/167,568
SOFFWARE: PALENTIN NOWER: 09/167,568

                                                                                                                                                                                                                                                    9
                                  The present sequence represents a Neisseria meningitidis antigenic polypeptide, designated BASB030. It was identified from N. meningitidis serotype B strain ATCC 13090. The nucleotide sequence was first identified in the Incyte Pathoseq database of unfinished genomic DNA sequences of this strain. The polypeptides or polynucleotides can be used in vaccine compositions for preventing N. meningitidis infections, be used for treating N. meningitidis disease. The products can also be used for diagnosis of disease, staging of disease or response of an infectious organism to drugs, as well as for drug screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  NITPDGQIIMTVKINKDSPAQCASGNQTILCISTKNLNTQAMVENGGTLIVGGIYEEDNG

The present sequence represents a Neisseria meningitidis antigenic polypeptide, designated BASB030. It was identified from N. meningitidis serotype B strain ATCC 13990. The nucleotide sequence was first identified in the Incyte Pathoseq database of unfinished genomic DNA sequences of this strain. The polypeptides or polynucleotides can be used in vaccine compositions for preventing N. meningitidis infections. e.g. bacteremia and meningitis. The antibodies against the protein can be used for treating N. meningitidis disease. The products can also be used for diagnosis of disease, staging of disease or response of an infectious organism to drugs, as well as for drug screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                of

in the Incyte Pathoseg database of unfinished genomic DNA this strain. The polypeptides or polymucleotides can be cine compositions for preventing N. meningitidis infections, and and meningitie. The antibodies against the protein can treating N. meningitidis disease. The products can also diagnosis of disease, staging of disease or response of an organism to drugs, as well as for drug screening.

The invention is useful for preventing C. trachomatis or C. pneumoniae infection in a host. The present amino acid sequence represents a Neisseria gonorthoeae protein as described in the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    254
                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to proteins from Neisseria gonorrhoeae. Also disclosed are the nucleic acid molecules encoding the proteins and antibodies that specifically bind to the proteins. The composition comprising the protein, nucleic acid or antibody is useful for the manufacture of a medicament for treating or preventing N. gonorrhoeae infection, this may be in the form of a vaccine or gene therapy. Sequences given in records ABP76736-ABP81046 represent nucleic acid molecules of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             9

                                                                                                                                                                                                                                                                                               The present sequence is the BASBO31 protein sequence-1, from strain Mc2931(ATCC 43617), derived from Moraxella catarrhalis. This polypeptide sequence has homology to Pseudomonas aeruginosa, PilQ fimbrial assembly protein. This sequence can be used for prevention and treatment of M.catarrhalis infections, like cities media, pneumonia, sinusitis and nosocomial infections. The antibodies and polymucleotide sequence can be used for diagnosing infections, exaging of disease and for determining the response of an infectious organism to drugs. The DNA sequence is also used as a hybridisation probe in screening process for identifying homologue and orthologs from other species.
                                                                                                                                                                           Novel polypeptides used as vaccines for treating Maraxella catarrhalis infections like otitis media and pneumonia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           399 MQARNIDMRQQGNIVNIAPRD-----BLLAXDKAFLQAEKDIADLGALYSQNFQLK

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           98 LÖTQNLSVLKHGNVWLISSKSIQSNOPTITEYIRLNYALAD---DVATL--IMGEKTQRG 152
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is the BASBO11 protein sequence-2, from strain Mc2931(ATCC 43617), derived from Moraxella catarrhalis. This polypeptide sequence has homology to Pseudomonas aeruginosa, PilQ fimbrial assembly protein. This sequence can be used for prevention and treatment of M.catarrhalis infections, like otitis media, pneumonia, sinusitis and nosocomial infections. The antibodies and polynucleotide sequence can be used for diagnosing infections staging of disease and for determining the response of an infectious organism to drugs. The DNA sequence is also used as a hybridisation probe in screening process for identifying homologue and orthologs from other species.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        97
Moraxella catarrhalis BASB031 protein-2, from strain Mc2931(ATCC 43617).
                              BASB031; strain Mc2931; ATCC 43617; PilO fimbrial assembly protein; diagnosis; treatment; otitis media; sinusitis; pneumonia; screening; homology; nosocomial infection; antibody; ortholog; hybridisation probe.
                                                                                                                                                                                                                                                                                                                                                                                                            polypeptides used as vaccines for treating Maraxella catarrhalis

```
The present sequence is the BASBO31 polypeptide, from strain Mc2911, derived from Moraxella catearhalis. This sequence has homology to Pseudomonas aeruginosa, pilo fimbrial assembly protein. This sequence can be used for prevention and treatment of M.catarrhalis infections, like otitis media, preumonia, sinusitis and nosocomial infections. The antibodies and polymucleonide sequence can be used for diagnosing infectious organism to drugs. The DNA sequence is also used as a hybridisarion probe in screening process for identifying homologue and orthologs from other species.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    polypeptides used as vaccines for treating Maraxella catarrhalis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    399 MQARNLDMRQQGNIVNIAPRD-----ELLAKDKAFLQAEKDIADLGALYSQNFQLK

This sequence has homology to Pseudomonas aeruginosa, PilQ finbrial assembly protein. This sequence can be used for prevention and treatment of M.catarrhalis infections, like otitis media, pneumonia, sinusitis and nosocomial infections. The antibodies and polymucleotide sequence can be used for diagnosing infections, staging of disease and for determining the response of an infectious organism to drugs. The DNA sequence is also used as a hybridisation probe in screening process for identifying homologue and

                                                                                                                                                                                                              The present invention provides the protein and coding sequences of proteins from Moraxella catarrhalis. These can be used to produce vaccines which protect against M. catarrhalis infection, which can obtitis media, respiratory infection, sinusitus, and pneumonia. The present sequence is a protein of the invention.

Also described are: (1) an isolated plasmid comprising the above expression vector; (2) a method of transforming a host cell comprising adding the above plasmid to host cells under appropriate conditions; (3) a transformed host cells comprising the above expression vector; and (4) a method for producing a protein comprising the sreps of obtaining a host cell comprising the steps of obtaining a host cell comprising the steps of obtaining a host cell comprising the the protein, and culturing the host cell under conditions for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Expression vector for producing heterologous proteins in host cells comprises a nucleic acid encoding a kinase and a DNA binding regulator which hybridizes under stringent conditions to nucleic acid

expression of protein. The expression vector of the present invention can be used for producing heterologous proteins in host cells, particularly, lipase in Pseudomonas. Lipases produced can be used in detergents and cleaning formulations in industrial processes. The invention provides a higher production level and efficiently express a heterologous protein. The present sequence represents XCPQ isolated from Pseudomonas alcaligenes, from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                        71
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     693 STKNLNTQAMVENGGTLIVGGIYEEDNGNTLTKVPLLGDIPVIGNLFKTRGKKTDRRELL

The invention also relates to an expression system comprising components of Pseudomonas alcaligenes lipase regulation cascade which includes kinases, DNA binding regulators, polymerases, promoters, upstream activating factors and secretion factors. DNA binding regulators of the invention are useful for regulating the expression of a lipase, where the lipase is useful in detergents and other cleaning formulations as well as a number of industrial processes. Various components of lipase regulation cascade is useful in expression methods and systems designed for the production of heterologous proteins. The present sequence is P. alcaligenes XCPQ, a secretion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Polynucleotide encoding DNA binding regulator, useful for regulating expression of lipase especially in pseudomonad, and lipase useful in detergents and other cleaning formulations and in various industrial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             DNA binding regulator; lipase regulation cascade; kinase; polymera:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is that of secretion factor XcpO of Pseudomonas alcaligenes. The secretion factor is encoded by an open reading frame identified in a cosmid (see AAR10870) derived from P. alcaligenes DNA. Secretion factors aid the secretion of other proteins from a cell. A new expression system comprises components of a lipase regulation cascade including a Kinase. DNA binding regulator, polymerase, a promoter, an upstream activating sequence, and secretion factors. The secretion factor is preferably camenber of the Xcp protein family (see AAB82256-68) and acts in concert with other members of the Xcp family. Plasmids and transformed cells are provided, and also host cells which further comprises a nucleic acid encoding a desired protein, especially an estense, hydrolase, lipase, isomerase, matase, transferase, kinase comprises (claimed). A hyper-producing strain can be

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the discovery of novel antibiotics, the essential genes themselves and the discovery of novel antibiotics, the essential genes themselves and the discovery of novel antibiotic development. The proteins are and Entercoccus facealis. The prount of also useful for the identification of potential new targets invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to dentify proteins used in proliferation, to express these proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for monologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein.

Note: The sequence data for this patent did not form part
of the printed sequence the sequences.
